

botanicalls™

kit

The Botanicalls Kit answers the question:
What's up with your plant?

Love your leafy friends

Botanicalls Kits let plants reach out for human help! They offer a connection to your leafy pal via online Twitter status updates to your mobile phone. When your plant needs water, it will post to let you know, and send its thanks when you show it love.

Easy to do it yourself

A moisture sensor placed into the soil connects to simple circuitry you solder together yourself. Twitter

updates are then sent out via an onboard Ethernet connection to the Internet, where they can be viewed online or routed to your mobile phone. Previous soldering experience is not required, and complete instructions are available online with detailed photos showing each assembly step.

The Botanicalls Kit includes

all the hardware you need to create a networked communication system for your plant:

- leafy printed circuit board
- all electronic components
- Internet cable and power supply
- soil moisture probes
- pre-configured Twitter account
- quick-start guide
- detailed online instructions
