

MIT Media Lab: XBee Workshop

Instructor: Rob Faludi

Plan for Today

- XBees
- Serial Terminals
- Addressing
- Basic Config
- Chat Project
- I/O Mode
- Arduino & XBee
- Workshop, Q&A

Student Introductions

- Name, where you are from, what you do
- What you want out of this workshop
- Aspirational pet animal

802.15.4

- low power
- low bandwidth
- addressing
- affordable
- small
- standardized
- popular for DIY, easy to learn

802.15.4 Topologies

- single peer
- multi-peer
- broadcast

ZigBee & 802.15.4

- ZigBee is built on top of the IEEE 802.15.4 protocol
- XBee radios can be purchased with or without ZigBee
- XBee 802.15.4 vs. ZNet 2.5 vs. ZB Pro vs. DigiMesh
- All ways are useful

ZigBee

- routing
- self-healing mesh
- ad-hoc network creation

ZigBee Topologies

- peer
- star
- mesh
- routing

Antennas

Breakout for Breadboards

Breakout Boards for breadboarding

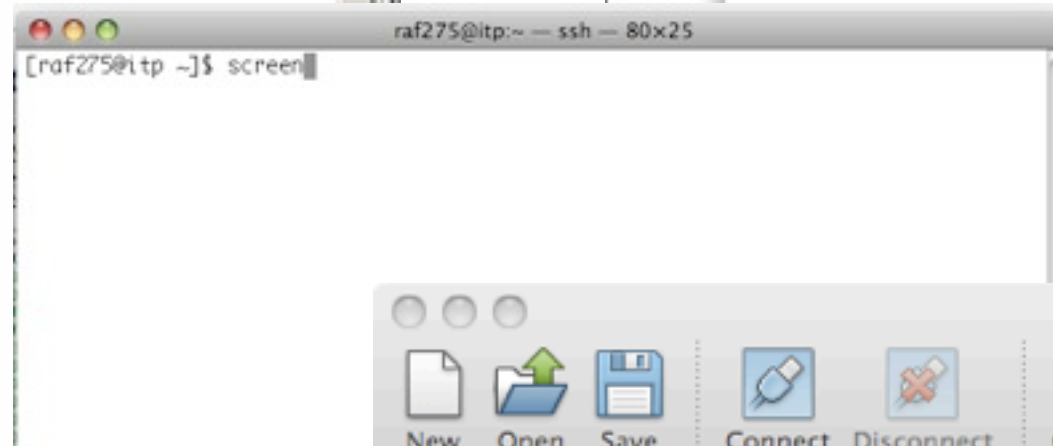

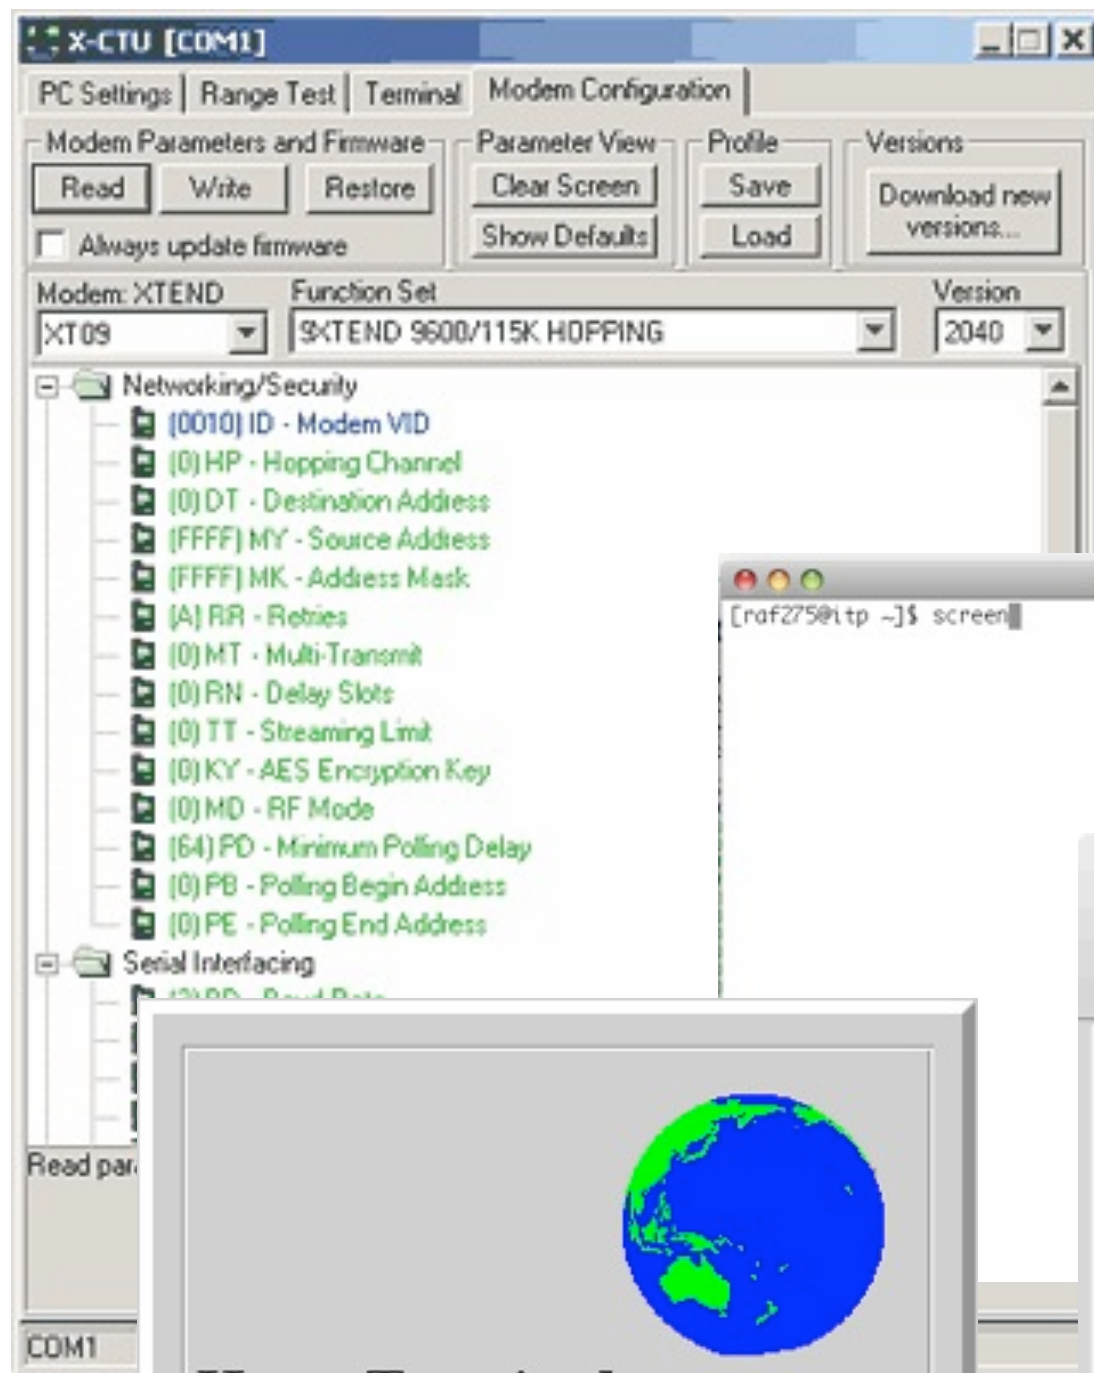

Soldering Breakout Boards: finished

XBee Explorer from Sparkfun

Serial Terminal Programs

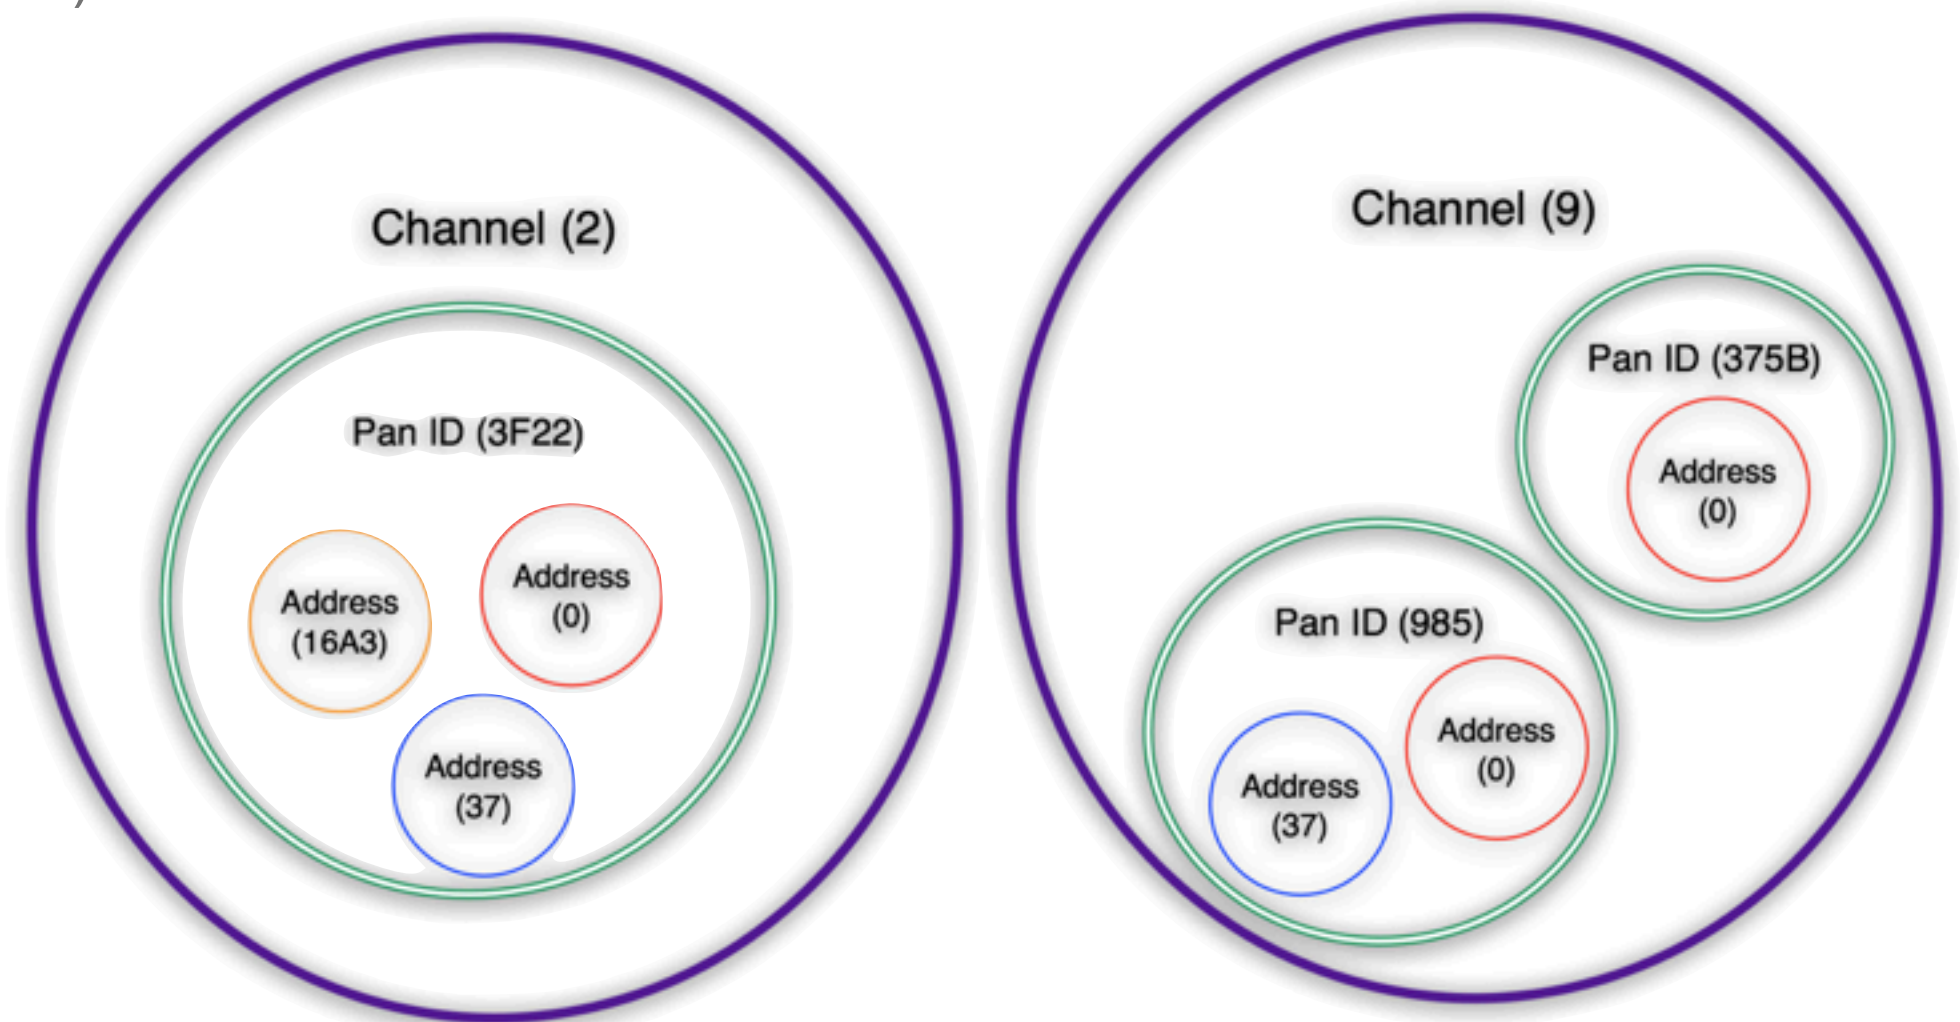

Serial Terminal Programs

- X-CTU: <http://www.digi.com/support/productdetl.jsp?pid=3352&osvid=57&tp=4&s=316>
- CoolTerm: <http://freeware.the-meiers.org/>
- HyperTerm: Windows Start Menu, Accessories, Communication
<http://www.hilgraeve.com/hyperterminal/>
- screen: Terminal program on the Mac (or Linux)
- plenty of others!
- settings: 9600 baud, 8 bits, no parity, one stop bit, no flow control

802.15.4 Addressing

Addressing Basics

- channels
- PAN ID
- 64 bit addresses (SN)
- 16 bit addresses

ZigBee Addressing

ZigBee Coordinator

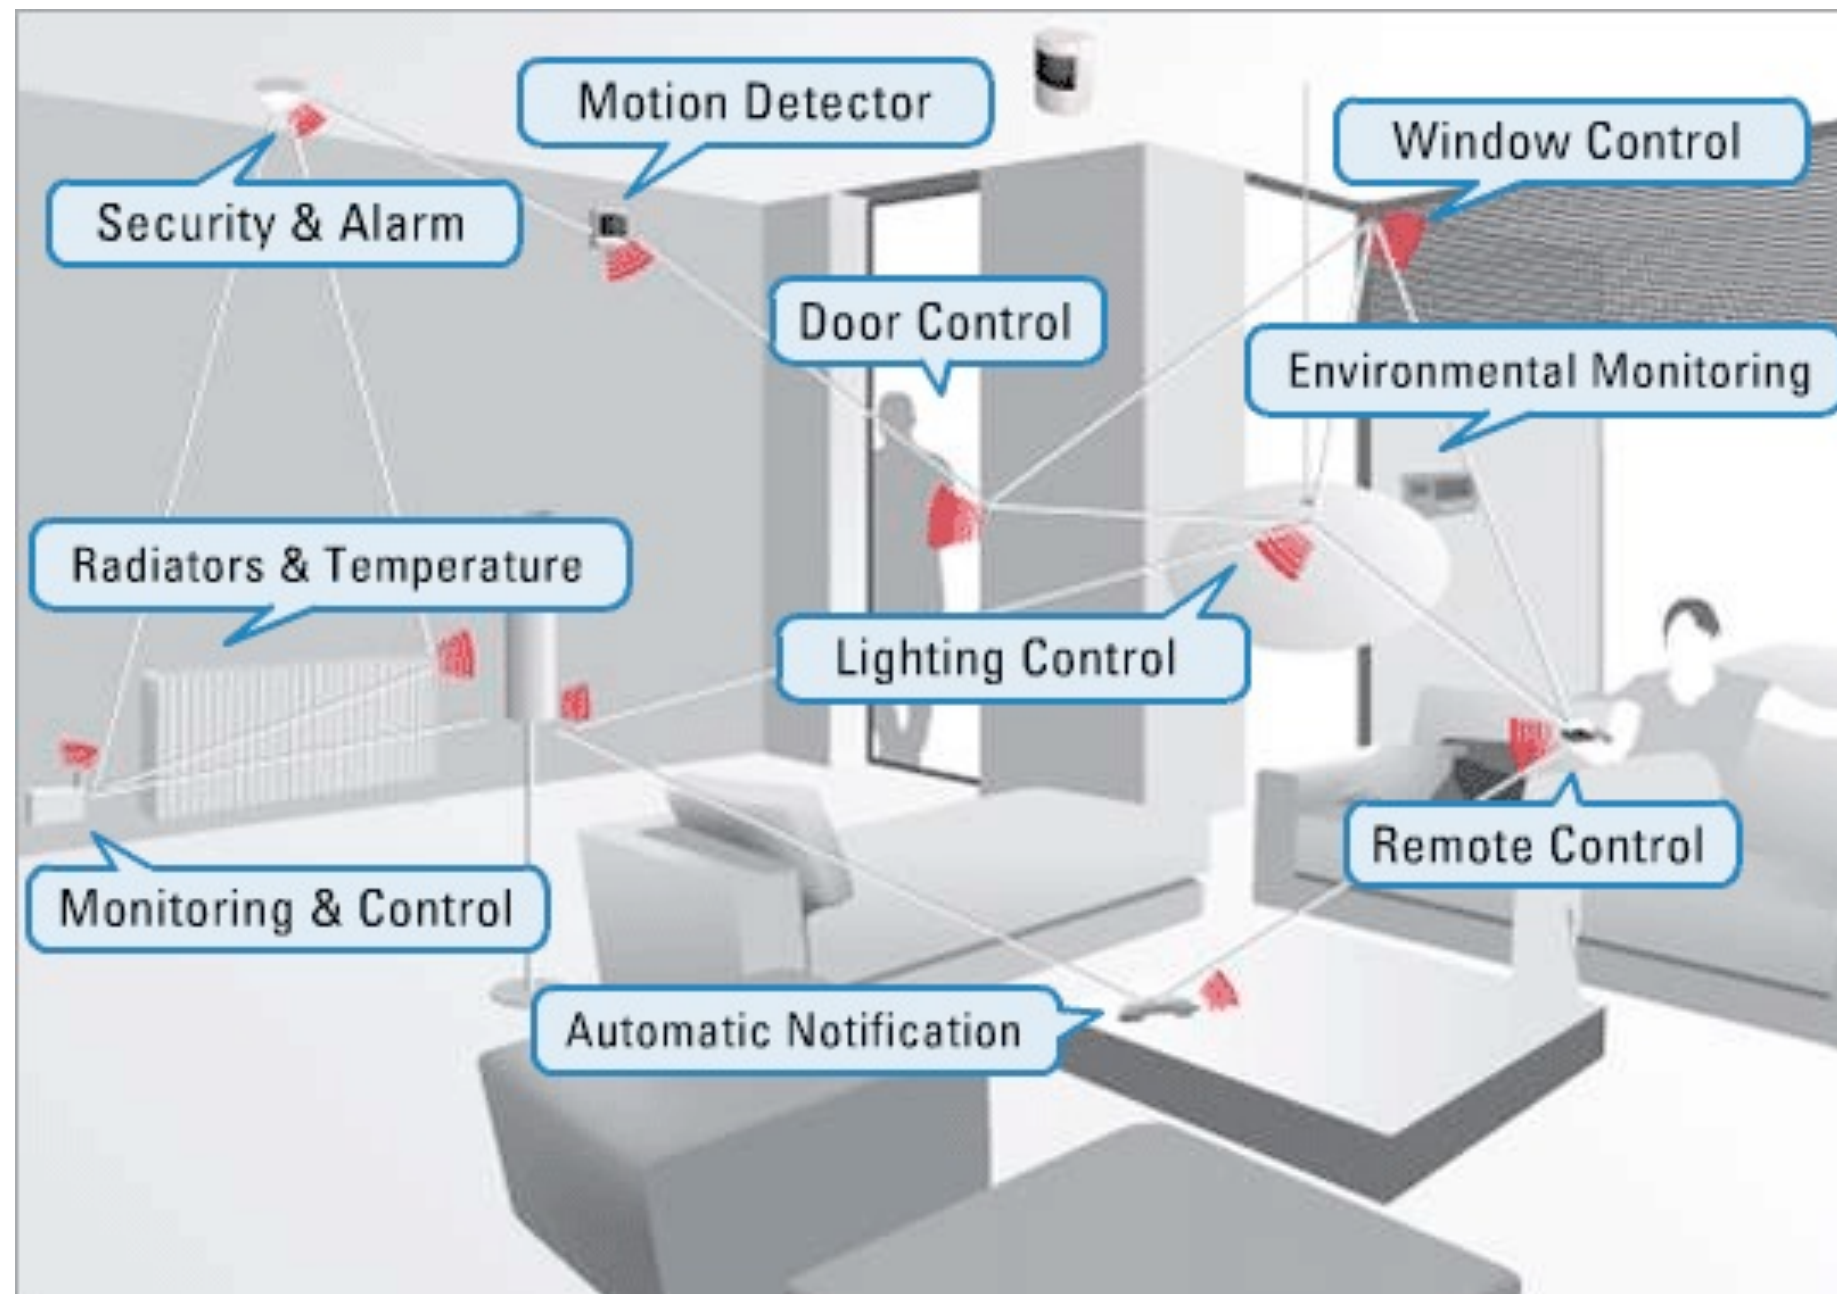

- Every ZigBee network must have a coordinator
- There can only be one coordinator
- Coordinator selects channel and PAN ID
- End devices and routers can then join the PAN
- Typically mains-powered
- Coordinator's 16-bit address is always 0

ZigBee Router

- Non-coordinator routers are optional to ZigBee networks
- Typically mains-powered
- Many can be on each PAN
- Issues a beacon request on startup to locate channel and PAN
- Routers can communicate with any device on the network
- Stores packets for sleeping end devices
- 16-bit address assigned by coordinator

ZigBee End Device

- *Optional* to ZigBee networks
- Typically battery-powered
- Many can be on each PAN
- Issues a beacon request on startup to locate channel, PAN and parent
- End devices can only communicate directly with their parent
- 16-bit address assigned by coordinator

XBee ZB

- Coordinator Firmware
 - for AT commands or API
- Router and End Device Firmware
 - for AT commands or API
- ...so 6 different firmware combinations (you'll always use 2 at the same time)
- and two power levels, regular and Pro
- and 4 antennas! whip, chip, U.FL and RPSMA.

Firmware Updates

Networking

- (0) ID - PAN ID
- (1FFE) SC - Scan Channels
- (3) SD - Scan Duration
- (0) ZS - ZigBee Stack Profile
- (FF) NJ - Node Join Time
- OP - Operating PAN ID
- OI - Operating 16-bit PAN ID
- CH - Operating Channel
- NC - Number of Remaining Children

Addressing

- (0) DH - Destination Address High
- (FFFF) DL - Destination Address Low
- () NI - Node Identifier
- (1E) NH - Maximum Hops
- (0) BH - Broadcast Radius
- (FF) AR - Many-to-One Route Broadcast Time
- (30000) DD - Device Type Identifier
- (3C) NT - Node Discovery Backoff
- (0) NO - Node Discovery Options

Getting modem type....OK
Modem's firmware not updated
Setting AT parameters..OK

9600 8-N-1 FLOW:NONE

XB24-ZB Ver:2241

Basic Configuration

Download and Install Software & Drivers

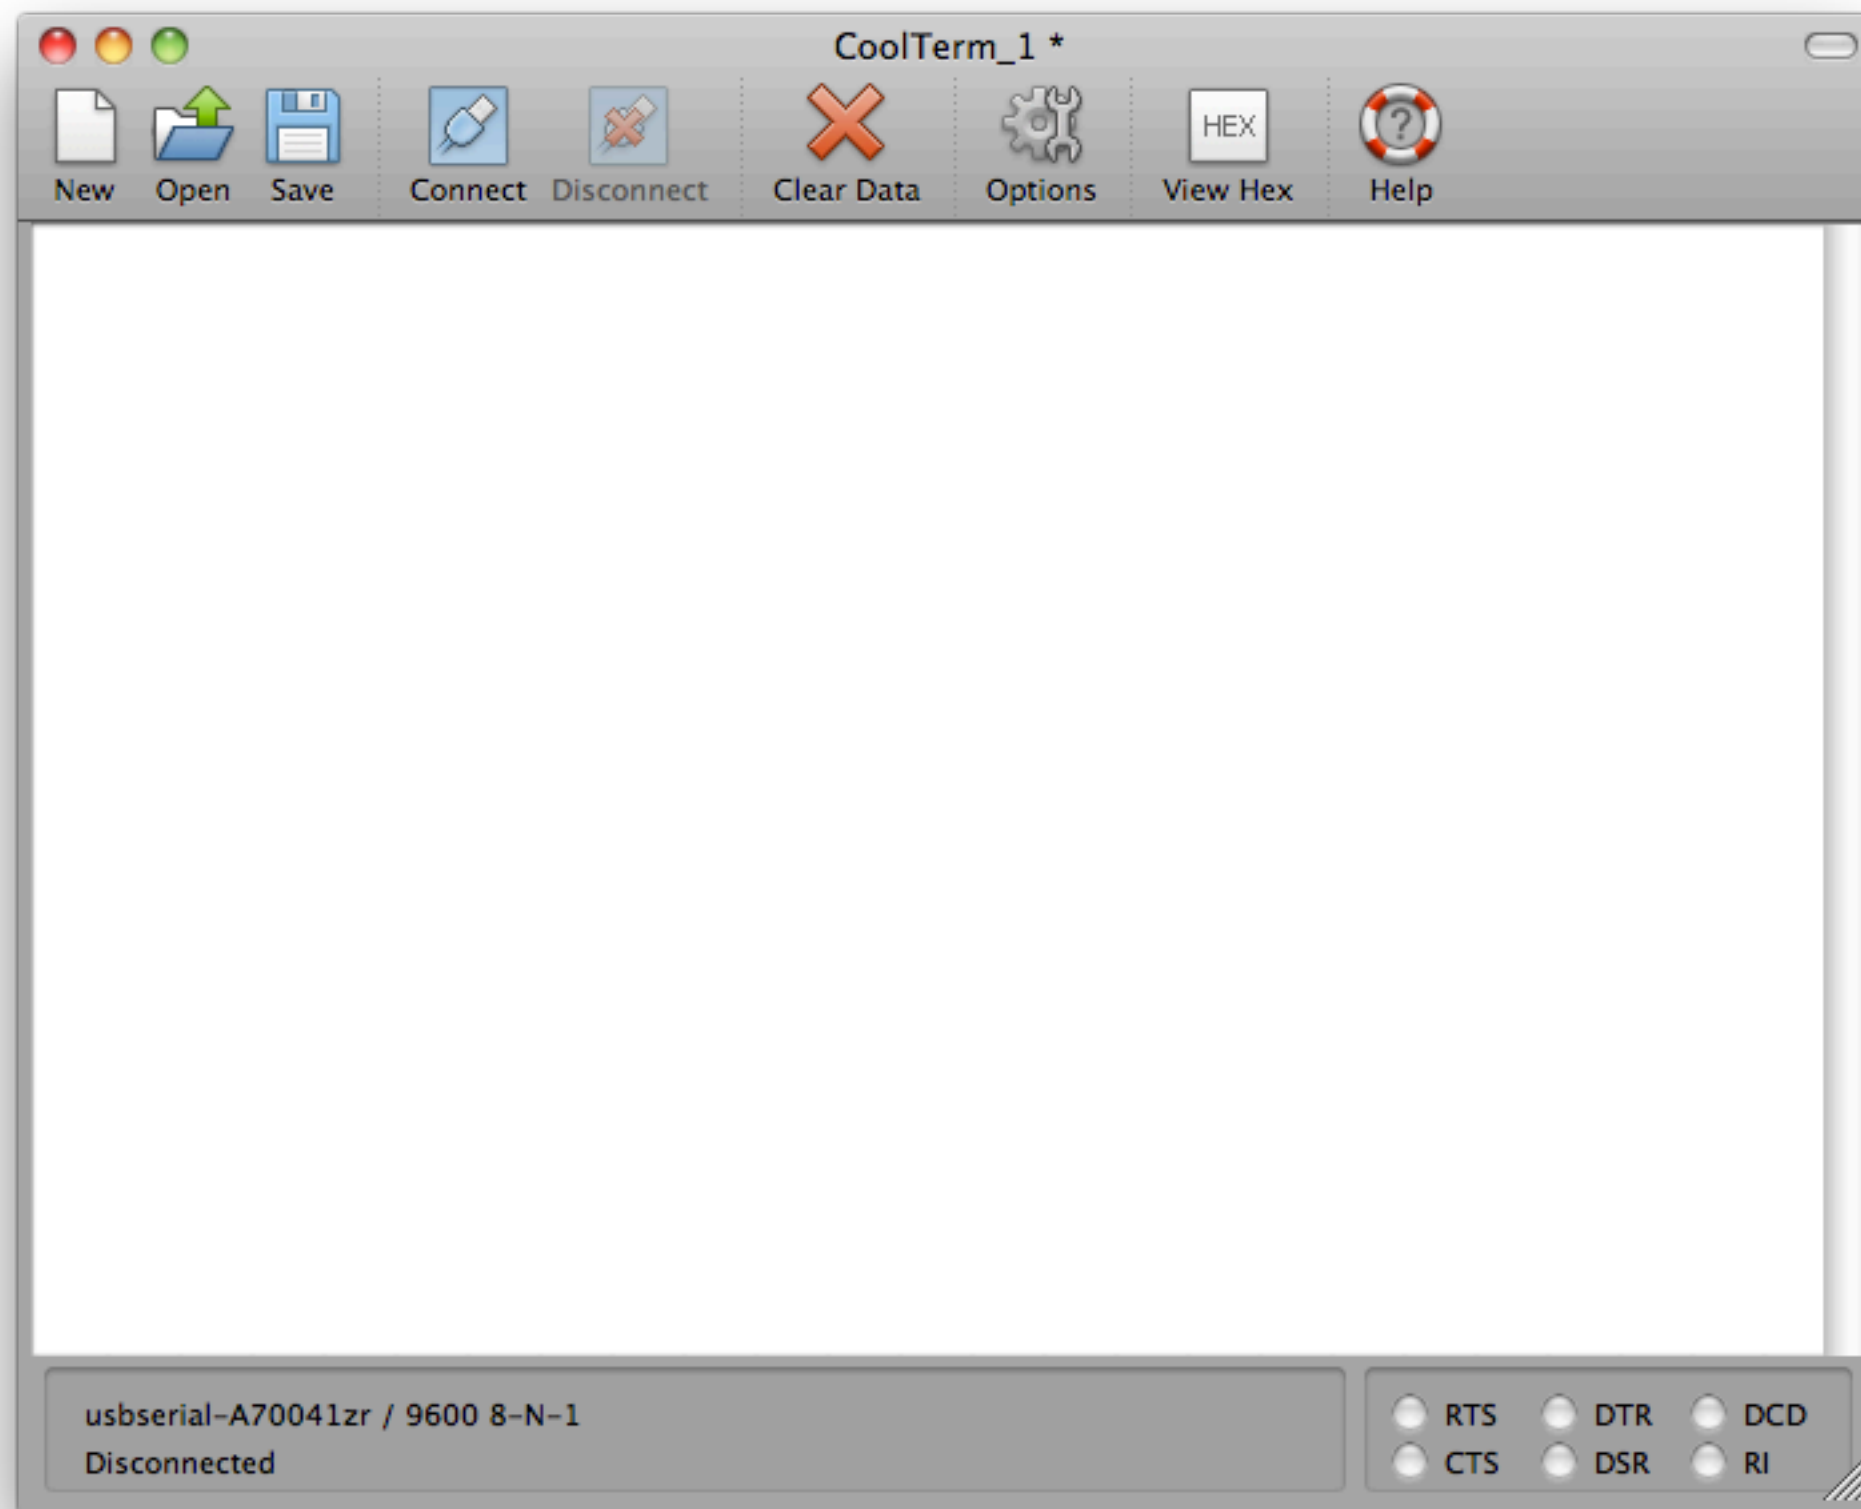

- Download & install the FTDI USB drivers:
<http://www.ftdichip.com/Drivers/VCP.htm>
- Download the CoolTerm:
<http://freeware.the-meiers.org/>

Other Serial Terminal Options:

settings: 9600 baud, 8 bits, no parity, one stop bit, no flow control

- X-CTU: <http://www.digi.com/support/productdetl.jsp?pid=3352&osvid=57&tp=4&s=316>
- Z-Term: <http://homepage.mac.com/dalverson/zterm/>
- HyperTerm: Windows Start Menu, Accessories, Communication
- Screen: Terminal program on the Mac (or Linux)

Open CoolTerm

Set Connection Options

Serial Port Options

Port:

Baudrate:

Data Bits:

Stop Bits:

Flow Control: ☐ CTS
☐ DTR
☐ XON

Terminal Options

☒ Local Echo

☒ Convert Non-printable Characters (ASCII View)

☐ Handle Backspace Character

Enter Key Emulation: ☒ CR+LF
☐ CR
☐ LF

Send String Options

☐ Terminate 'Send String' Data

Termination String (Hex):

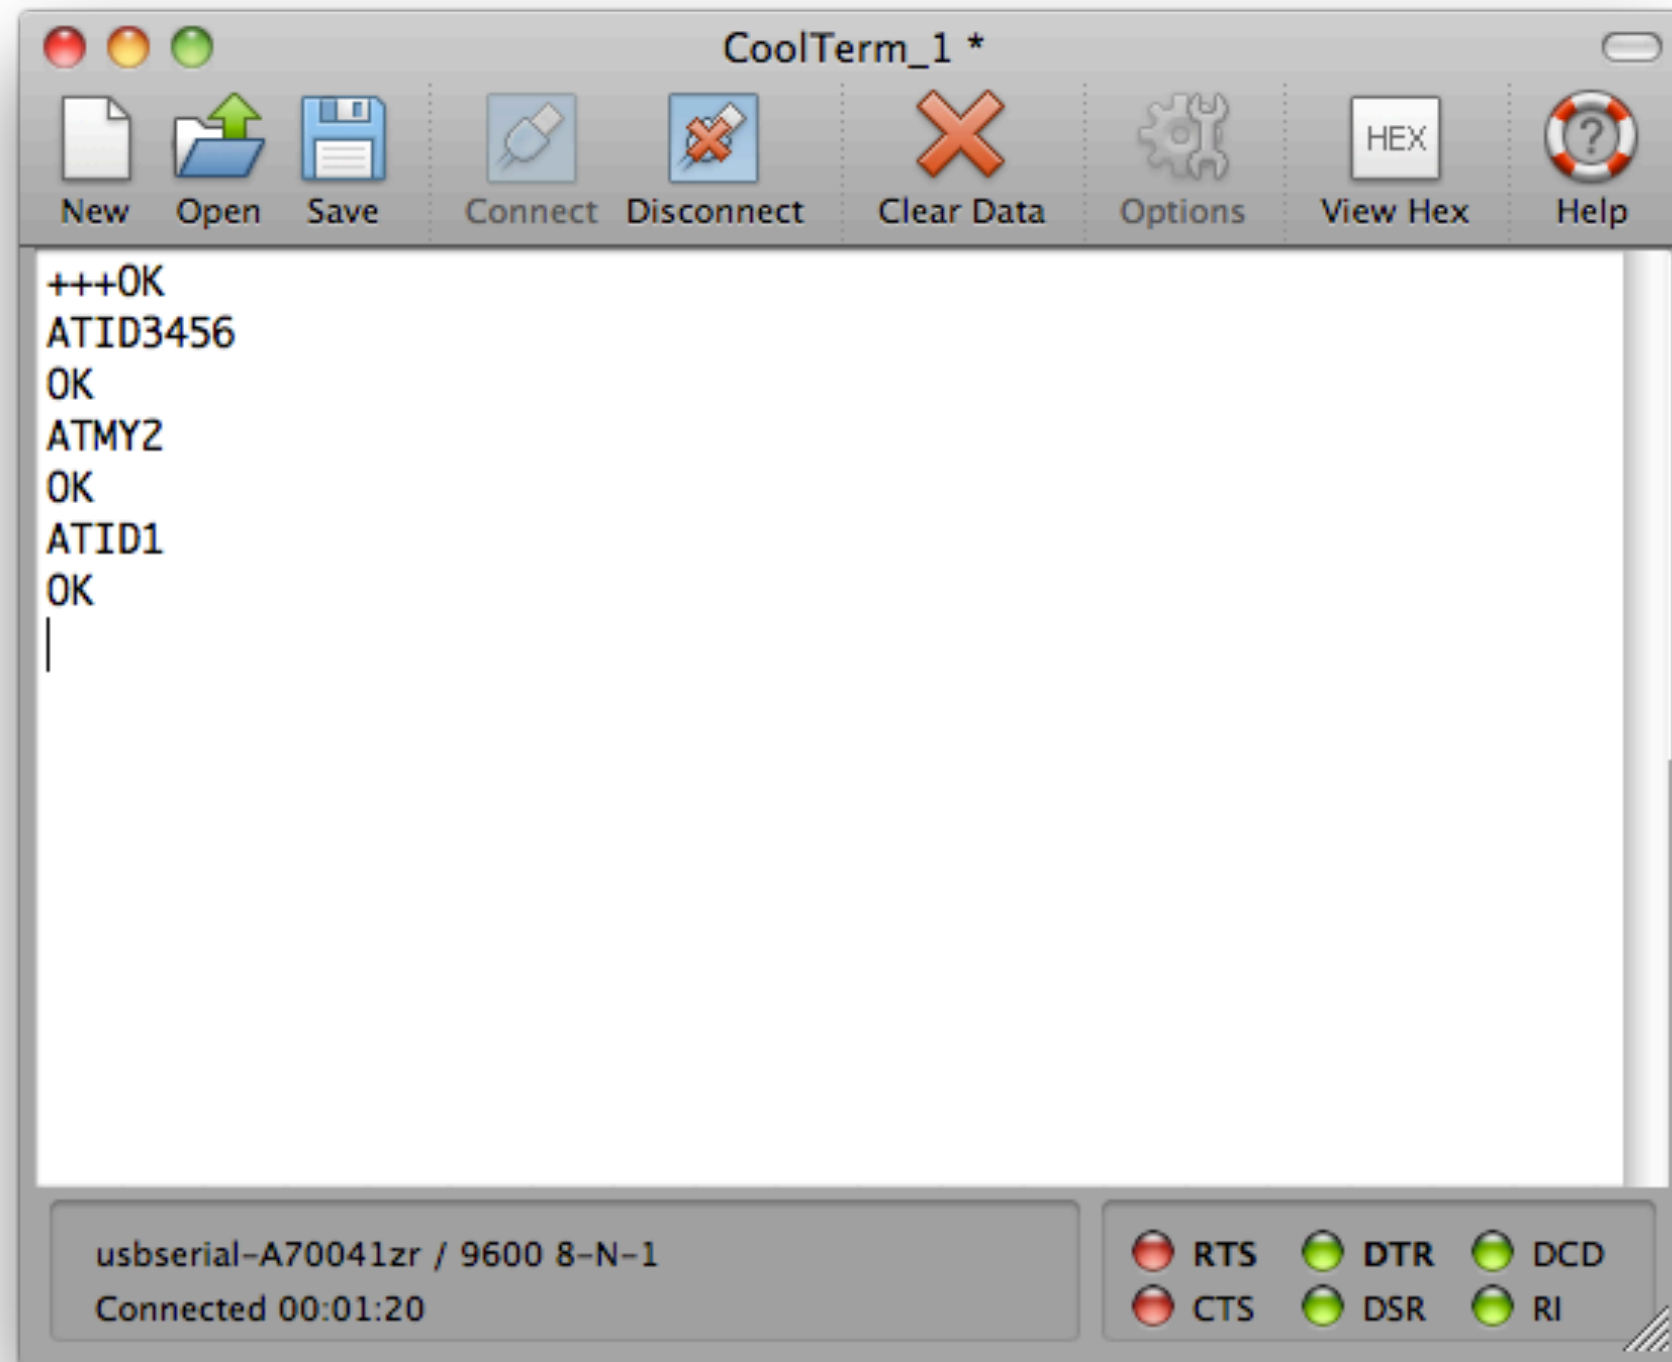

Special Options

☐ Loop back received data

☐ Ignore receive signal errors

Configure your radio with AT commands

- Configure your radio

Baud, Bits and Parity

- Baud rate: 9600
- Data bits: 8
- Stop bits: 1
- Parity: None
- Flow control: none for now...

Data Mode vs. Command Mode

- Idle Mode, transmit and receive data
- Command Mode, talk to the XBee itself
 - +++ *"Yo, XBee"*
 - AT *"Attention!"* (Hayes command set)
 - always press enter after AT commands
 - never press enter after +++

AT Commands

Some AT Commands

- AT -> OK
- ATMY -> my address (*not settable for ZigBee!!*)
- ATDH, ATDL -> destination address hi/lo
- ATID -> personal area network ID
- ATCN -> end command mode
- ATWR -> write configuration to flash memory
- ATRE -> reset to factory defaults

Addressing In-Depth

- SL, SH: fixed serial number address
- MY: configured local 16 bit address
- DH, DL: destination address low and high
- ID: Personal Area Network ID
- Broadcast FFFF
- Broadcast PAN FFFF

Assignment

- Pick a PAN ID now and document it.

Basic 802.15.4 Chat

Create a Basic 802.15.4 Pair

- Two radios
- Use the 16-bit addresses for destinations
- HANDOUT
- Remember, the radios work reliably, troubleshooting is mostly about figuring out what they're doing.

Create a Basic ZigBee Pair

- One coordinator and one router
- Use the 64-bit addresses for destinations
- ATNR will reset your network layer, useful if you join the wrong ID
- Remember, the radios work reliably, troubleshooting is mostly about figuring out what they're doing.

I/O Intro

- For simple input and/or output
- Eight digital input/outputs
- One additional digital output
- Seven analog inputs
- Two analog outputs
- But not all at once! Pins are shared.

I/O Why

- Why:
 - Save space, save power, save weight and save money
 - Reduce complications for simple projects
- Why not:
 - Limited inputs/outputs
 - No access to logic
 - Might make complicated projects even more complicated

Input/Output Wiring

I/O AT Commands

- ATD0...D8 -> configure pins for I/O
- ATIR -> sample rate
- ATIT -> samples before transmit
- ATP0...P1 -> PWM configuration
- ATIA -> I/O input address

I/O AT Commands: ZigBee

- ATD0...D7 -> configure pins for I/O (D8 and D9 not supported yet)
- ATP0...P2 -> configure pins 10 - 11 for I/O (P3 not supported yet)
- ATIR -> sample rate
- samples before transmit is always 1
- destination address receives sample info
- ALL PINS READ BETWEEN 0 AND 1.2 VOLTS ONLY

XBee ZigBees inputs are 1.2V range

Voltage Divider to map 3.3V range to 1.2V range

Setting I/O Pins

- ATDx 0 Disabled
- ATDx 1 Built-in Function (sometimes)
- ATDx 2 Analog Input (sometimes)
- ATDx 3 Digital Input
- ATDx 4 Digital Output, low to start with
- ATDx 5 Digital Output, high to start with
 - ...so ATD32 would do what?

Input/Output Settings

- ATIR
sets the data sample rate (uses hexadecimal notation)
- ATIT
how many samples transmitted at a time
- ATD0
mode for digital pin zero (3=digital input, 5=digital output)
- ATIA
remote address that's allowed to control local pins
- ATWR
writes the settings to firmware (like saving to a disk)

XBee and Arduino

Why Arduino

- local logic
- pinouts
- fast prototyping
- connect to a huge variety of components, SPI, IC², PWM, etc.

Arduino Serial Library

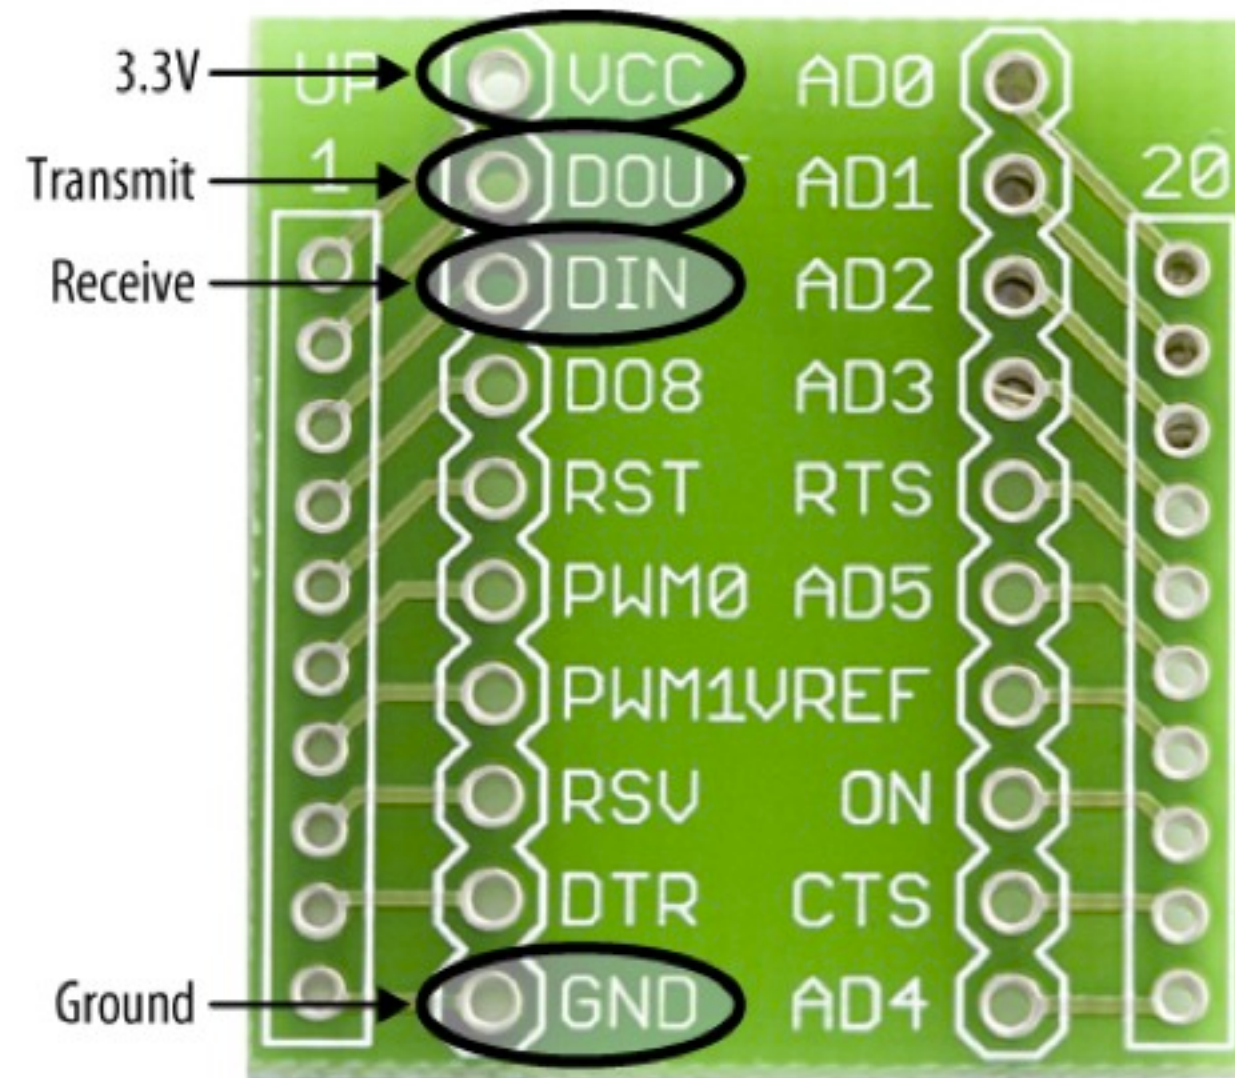

- `Serial.begin(speed)`
- `Serial.available()`
- `Serial.read()`
- `Serial.flush()`
- `Serial.print(data)`
- `Serial.write(byte)`

NEW Software Serial

- 115K baud max, all pins are okay to use
- `SWserial.read()` does not block
- `serial.available()` function in software serial
- buffering!
- good choice for input, great for debug output w/ USB-serial converter
- <http://arduiniana.org/libraries/NewSoftSerial/>

Breadboard Hookups

Wiring

XBee Arduino Breadboard Layout

Power, Ground

TX, RX

XBee Connections (pin 1, 2, 3 and 10)

Remember!

- Use only +3.3 Volts. More than +7 Volts will kill your radio
- If you use a voltage regulator, always use decoupling capacitors. The radios often don't work without them.
- XBee TX goes to Arduino RX and vice versa.
- Unplug the TX & RX before uploading Arduino code (or use switches)
- You can't send infinitely fast. Try putting a 10 ms delay into your loop.
